

ASE MANAGEMENT BRIEF

Participant: Brandon Lee Still

Date Completed: August 6, 2026

Prepared by: Intake Specialist / Center Director

1. RISK PROFILE

- Risk Level: High [141]
 - Primary Domains:
 - Antisocial Pattern (Main Driver overridden by LSCMI Supplemental) [10]
 - Companions (Secondary Driver overridden by LSCMI Supplemental) [10]
 - Education/Employment (High-scoring LSCMI Domain) [143]
 - Domain Indicators:
 - Antisocial Pattern: History of reactive hostility, impulsivity, poor self-management, physical altercations (including a fight while in federal prison), and an intimidating style with strangers to enforce physical boundaries [9, 114, 116].
 - Companions: High density of criminal acquaintances and friends, with very few anticriminal supports in his active social network [99, 191].
 - Education/Employment: Chronic vocational instability (only two jobs in his life, both in his 20s), multi-year gaps of unemployment, and high school incomplete (with a history of disciplinary suspensions) [91, 93, 161].
-

2. BEHAVIORAL INDICATORS

- Typical Triggers:
 - Interpersonal Disrespect: Perceived disrespectful behavior or challenging actions from strangers in the community [114]. Brandon explains that he "sets the tone" and lets people know he "ain't going to play" to avoid being "run over" like other guys coming out of prison [114, 115].
 - Emotional Sadness / Isolation: Situational stress or emotional lows where he tends to isolate, withdraw from communication ("gets in his feelings" and refuses to answer his phone), and avoid support networks [122].
- Escalation Tendencies:
 - Physical Force / Defensive Hostility: Under perceived disrespect or threat, he tends to "set the tone" and establish boundaries aggressively, which historically led to fights, including a physical altercation while in federal prison [114, 116].
 - Hostile Outbursts: Hostility and impulsive expressions are prominent when he feels others are trying to exploit or disrespect him [9, 114].
- Decision-Making Patterns:

- Impulsive / Acting Before Thinking: Highly impulsive with clear problem-solving and self-management skill deficits; has an increased tendency to act before thinking [9, 113].
 - Criminogenic Financial Resolution: Historically resolved financial and drug-seeking needs by engaging in drug trafficking (distribution of methamphetamine and heroin) to fund his daily habit, rather than pursuing legal, stable employment [102, 105].
 - Authority Response Style:
 - Polite Compliance with Undercurrent of Denial: Brandon generally presents as polite, cooperative, and superficially charming with program staff and supervisors, expressing a strong desire to comply with supervision and complete it early [9, 108]. He completed RDAP and has no disciplinary reports in prison [89, 108].
 - Denial & Minimization Barrier: However, he exhibits significant responsivity barriers related to denial and minimization; he frequently makes excuses for his behavior and blames others for his present difficulties [5, 6].
 - Substance Relapse Patterns:
 - Self-Medication for untreated ADHD: Historically dependent on heroin and marijuana, using daily depending on the year [102]. While he has been clean for 5.5 years, his substance use was deeply tied to self-medication for untreated childhood ADHD, boredom, and a lack of structured daily routine [105, 109]. Future relapse risk is highly correlated with unstructured free time, peer pressure, or untreated ADHD symptoms [99, 105, 110].
-

3. PATTERN OVER TIME

- Age at First Justice Involvement:
 - First arrested at age 18 [88, 89]. (Note: Intelius records a drug possession charge filed in Aiken, SC, in May 2014 [16, 17]. Under his stated DOB of 1999, he would have been 15; under his Intelius DOB of 1989, he would have been 25. He reports his first arrest was "like 18" [88].)
- Number/Frequency of Incarcerations:
 - This is his first incarceration sentence [87].
 - His current federal sentence of 120 months (10 years) for conspiracy to distribute methamphetamine and heroin resulted in serving approximately 6 years in custody before his transitional release to a halfway house [1, 88, 89].
- Recidivism Timing Patterns:
 - Brandon completed his previous state-level First Offender Act probation successfully [89, 90]. However, he was actively engaging in the federal drug conspiracy *while* on state probation, indicating a pattern of continued criminal involvement hidden under superficial compliance [90].
- Escalation or Stability Trends:
 - His criminal trajectory escalated from local possession and trafficking charges (which were dismissed under the state First Offender Act) to a major federal conspiracy charge involving high-volume meth and heroin distribution [88, 102]. This represents an escalation in both criminal sophistication and legal consequences [88].
- Supervision Violation History:

- No official technical supervision violations or revocations on record; his state probation was completed successfully [89, 90].
-

4. ACUTE / EMERGENCY NEEDS

No acute needs identified at intake. [37]

5. STRUCTURAL STABILITY FACTORS

- Housing Stability Level: Stable. He is currently residing in a transitional federal halfway house which he finds decent and liveable [121]. This placement allows him to reside rent-free and save money [111].
 - Driver's License Status: Satisfactory. He has a valid driver's license, regular State ID, Social Security card, and birth certificate [87].
 - Education Credential Status: Completed. Finished 10th grade in academic high school and subsequently completed an online GED through Christian Kingdom Academy, which was officially recognized and registered by the BOP [91, 92].
 - Recent Substance Use: Abstinant. Clean from all illicit substances for approximately 5.5 years, having maintained sobriety since his first six months of federal incarceration [103].
 - Employment History Pattern: Highly Unstable. Brandon has only held two jobs in his entire life (both in his 20s) and has experienced severe multi-year gaps of unemployment, including a continuous three-year period of unemployment immediately preceding his arrest [90, 91]. He lacks vocational training or a trade, which presents a major barrier to long-term financial independence [105].
 - Supervision Intensity: High. Undergoing 5 years of federal supervised release following his transition out of the halfway house, requiring strict compliance, employment, and regular drug testing [1, 108].
-

6. LEGAL & PLACEMENT CONSTRAINTS

- Pending Charges: None [118].
- Court Obligations: Sentenced to a \$100.00 special assessment in his federal judgment [1].
- Supervision Restrictions:
 - Subject to standard federal supervision travel and association restrictions [108].
 - ADHD Medication Restriction: A critical constraint exists where Federal Supervision (FS) does not allow him to take Adderall (his preferred and historically effective childhood ADHD medication) while residing at the halfway house [110]. He is forced to wait until he transitions to standard probation to resume it, causing significant daytime sleepiness and requiring him to coordinate with mental health staff for alternative, non-stimulant medications [110].
- Sex Offender Registry Requirement: No [117].

- Movement/Contact Restrictions: Halfway house curfew, sign-out logs, and programmatic requirements [121].
-

7. RESPONSIVITY & ENGAGEMENT PROFILE

- Literacy Limitations: None identified; average literacy. Completed 10th grade and has a GED [91, 92].
- Cognitive Considerations:
 - Low Verbal/Learning Intelligence: Reports significant learning difficulties during school [7, 79]. He may struggle with highly abstract or heavily text-based programming, requiring practical, concrete, and highly structured cognitive-behavioral interventions [245].
- Trauma Reactivity:
 - Grief & Loss: Severe family-related trauma and grief. He has lost three brothers (two to drug overdoses, one to gun violence) [97].
 - Childhood Domestic Violence: He witnessed severe domestic violence (parents fighting) during childhood, which likely contributes to his hyper-vigilance and reactive boundary-setting [124].
- Authority Sensitivity:
 - Defensive Boundary-Setting: While polite and cooperative, Brandon is highly sensitive to perceived disrespectful treatment or feeling that others are trying to "run over" him, which can trigger defensive hostility [114].
 - Excuses and Blame: He frequently engages in denial and minimization, making excuses and blaming others for his present difficulties [5, 6].
- Motivation Style:
 - High Motivation for Legitimate Success: Highly motivated to stay out of prison, maintain employment, pass drug tests, and earn early termination from supervision [108].
 - Prosocial Peer Influence: His primary motivation is reinforced by his best friend, who successfully turned his life around after serving a 10-year prison sentence and made \$180,000 legally in his first year doing roofing adjustments [100]. This relationship is a critical prosocial lever that should be utilized in case planning to demonstrate that legal financial success is achievable [102].
- Learning Preferences / ADHD Accommodations:
 - Untreated ADHD Accommodation: Brandon has an active childhood diagnosis of ADHD [109]. Currently untreated with stimulants due to federal supervision rules [110], he suffers from severe daytime sleepiness, lack of focus, and restlessness [110, 122].
 - Structured, Active Modules: He learns best through hands-on, active, and brief educational modules. Long, unstructured lectures will fail.
 - Physical Outlet Integration: Staff should actively support his daily weightlifting routine at the gym, which serves as his primary physical outlet for stress and energy management [98, 115].

- Calm, Coaching Style: Case managers should use a calm, firm, coaching style that avoids direct power struggles, respects his boundaries, and focuses on concrete, legal financial goal-setting [27, 100].
